## GEOLOGICAL SURVEY PROFESSIONAL PAPER VOLUME 864, PT. 1

To download **Geological Survey professional paper Volume 864, pt. 1** eBook, you should access the link below and save the document or gain access to additional information which might be have conjunction with GEOLOGICAL SURVEY PROFESSIONAL PAPER VOLUME 864, PT. 1 ebook.

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 30 pages. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1975 Excerpt: . . . FOR THE JOINTING SYSTEMS Joint systems were developed in the Watchung Basalt as a result of stress fields set up by three geologic processes which acted upon the rocks of the graben. Cooling of the lava flows gave rise to the cooling joints. The tectonic forces associated with the post-Triassic folding and the accompanying deformation of the graben produced the tectonic joints. During the Pleistocene Epoch the northern part of the eroded remnant of the former graben was covered by a continental glacier which compressed the rocks beneath it; and, after the ice melted, the resulting decompression of the basalts is thought to have produced sheeting (Faust, unpub. data). PETROCHEMISTRY The Watchung Basalt flows and the Palisade Diabase intrusion were probably derived from the same magma chamber. Accordingly, the chemistry of the Watchung Basalt is of prime interest in discussing the course of differentiation in the Palisade Diabase sill, but surprisingly few analyses of the basalt exist. Lewis (1908) used eight superior chemical analyses to interpret the chemistry of these rocks. Five of the analyses were for First Mountain and three for Third Mountain. He placed these samples in their approximate stratigraphic position--designated as lower, middle, and upper layers--in order to discuss their significance. The analyses of the rocks from First Mountain suggested that  $\text{Al}_2\text{O}_3$  and  $(\text{Fe}_2\text{O}_3, \text{FeO})$  remained essentially constant throughout the thickness of the sheet and that  $\text{Na}_2\text{O}$  is at a minimum at the middle layer, whereas  $\text{CaO}$  is at a maximum. Silica increased only slowly towards the top...
